

Light comes in, heat goes out

As summer approaches, thoughts of hot, sunny days help to start our planning for outdoor activities. But we still spend a lot of time indoors, and having the sunshine inside is great – but not the heat!

Hot air that naturally accumulates in the house (and rises) can easily be let out with an opening skylight, allowing your air conditioning system to work much more

effectively (saving you money). Your air conditioning will even work upstairs!

Today's worry-free skylights are available as electric, remote-controlled, opening units with self-closing rain sensors. 🌧️
