

The *hint* is to *tint*

Modern window films have come a long way in a short time. Now you can get scratch-resistant coatings, multi-layer films, UV filters, advanced adhesives and a multitude of metals or ceramics sandwiched inside polyester.

Window films serve many purposes for today's buildings. They can reduce damaging UV rays by 99.9%, protecting occupants, wood and fabric furnishings alike. Southern, eastern and western exposures can create hot spots in a house that air conditioning cannot keep cool. With the ever-increasing cost of energy, films can reduce energy bills by reducing solar heat gain through windows and doors.

Some films are more reflective than others, offering a reflective barrier for daytime privacy. Others are better suited to cutting glare from TV screens or computer monitors. Where round-top windows limit the choice of window treatments, window film could be the perfect solution.

Your eyes and your house are both worth protecting. So, it's good advice to wear sunglasses and to tint your windows. 🌿
