

REDUCING THE APPEARANCE OF cellulite

Treatments produce a healthier glow and better tone in the skin.

BY ELEANOR WELSH

Some 85-90 per cent of females past puberty will develop some degree of cellulite. It occurs in overweight and very thin women. Cindy Crawford has it. So does Jerry Hall. Hormones, heredity, smoking, lack of exercise and poor diet all play a role.

Achieving a smooth appearance to problem cellulite areas was once a challenge – either endure invasive, often painful procedures, or invest time and money in questionable topical treatments or diets.

As women age, the collagen in the skin and supporting ligaments thins, providing less support. This helps create the notorious ‘cottage cheese’ or ‘orange peel’ look that mars the skin.

Up until now, experts say, little could be done about cellulite that was safe, lasting and truly effective. The VelaSmooth Medical Cellulite treatment is the first and

only FDA-approved cellulite treatment in North America.

This treatment will not only reduce the appearance of cellulite by 90-95 per cent, it also tightens the skin and reduces the circumference of the thighs, and the size of the buttocks and the waist. The treatments produce a healthier glow and better tone in the skin.

How the VelaSmooth works is a combination of radio frequency and light energies, plus tissue mobilization with gentle suction. The energy heats fat cells. At the same time, the device gives off infrared light that increases the elasticity of the skin and heats the fat below the surface, allowing it to be broken up and smoothed out by the device’s metal rollers. ❁
